

Guide to Tables

Introduction

Several types of tables are available in the Results section of the IICC website at <http://iicc.iarc.fr/results>. This document explains the content of the different types of tables: registry-specific and comparative tables. It also provides a list of all datasets and indicates with a sign + the tables which are used to present each dataset.

Registry-specific tables

Full table for a single registry

Full tables were prepared for the registries that included a sufficient number of cases in the dataset: at least 200 cases in the age range 0-14 years or at least 300 cases in the age range 0-19 years. The full registry-specific tables consist of three pages. The first page provides the results for both sexes combined, the second shows results by sex, and the third has a table with population data.

The title of this table contains the name of the country and the period of coverage of the dataset. For subnational registries, the name of the region covered is given. If the data come from a paediatric cancer registry or relate to a specific ethnic group, this is also indicated. Two paediatric cancer registries provided data for selected tumour types only, and this is indicated by the word “specialized”. The world region of the dataset or country is indicated in the upper left corner.

Within the tables on the first two pages, data are presented for 12 main diagnostic groups, highlighted with blue shading, and the total for all neoplasms combined, as well as for 47 diagnostic subgroups. The definition of the diagnostic groups and subgroups follows the International Classification of Childhood Cancer, 3rd edition (ICCC-3) [1] and matches the abbreviated labels shown in these incidence tables. The following abbreviations are used: BL, Burkitt lymphoma; CMD, chronic myeloproliferative diseases; CNS, central nervous system; MDS, myelodysplastic syndromes.

In the table on the first page, the first seven columns show the numbers of cases in 5-year age groups and the totals for two age ranges, 0-14 and 0-19. For paediatric registries that collect data only for the age range 0-14 years, there are no columns for the age group 15-19 or the age range 0-19.

The next four columns report the percentage represented by a relevant diagnostic category within a total group. There are two columns for each of the two age ranges (0-14 and 0-19). The first column of each pair, entitled “All”, indicates the percentage of the number of cases diagnosed in a given diagnostic group or subgroup within the total number of cases for that age group, and the second column, entitled “Group”, shows the percentage represented by each subgroup within the main diagnostic group. The percentages for the age range 0-19 do not appear if data were not collected for cases aged 15 years or older.

The next nine columns show incidence rates. Age-specific rates are shown for age 0, 1-4, 5-9, 10-14, and 15-19 (the latter does not appear for the paediatric cancer registries). Age-standardized rates (ASR) were calculated by the direct method, using the age-specific rates for the age groups 0-4, 5-9, 10-14 and 15-19 and the weights of the World standard population for these age groups according to Segi [2], namely 12, 10, 9, and 9. The cumulative incidence rates were calculated as the sum of the age-specific incidence rates for the 5-year age groups, each multiplied by 5, the number of years contained in each age group.

The column entitled MV % (microscopic verification percentage) indicates the proportion of cases in each diagnostic category with the diagnosis based on microscopic examination of neoplastic tissues. The column entitled DCO % (death-certificate-only percentage) shows the proportion of cases ascertained from death certificates only. If only zeroes are indicated in this column, it is possible that the registry does not have access to the death certificates of residents who died within the registration area. [Indicators of data quality](#) should be consulted to find out whether this was the case.

A note underneath the table indicates the number of non-malignant neoplasms included in the marked diagnostic groups, if applicable.

The sex-specific table on the second page provides some of the statistics described above, derived separately for males and females. In addition, the male-to-female ratio (M/F) is provided. It was calculated as the quotient of the number of males to the number of females in the given diagnostic group and age range.

The table on the third page shows the person-years covered by the registry over the indicated period for each sex by four or five age groups as well as for the two age ranges, 0-14 and 0-19. The average annual population for the two age ranges is also provided.

Table for a pool of registries

These tables were produced for countries where several subnational registries contributed to IICC-3. For countries in which the subnational registries differed too much in certain aspects, pooled tables were not produced. The pools of registries include either paediatric or general cancer registries; the two types of registries did not contribute to a single pool.

The covered population is described by the country name and the number of registries contributing to the pool. The indicated period shows the earliest and the latest years covered by any of the contributing registries.

The content of the first three pages of the Full table for a single registry described above applies to the pooled tables.

The fourth page of a pooled table presents a list of the registries that contributed to the pool, and for each registry, the following details are listed: the period in years for which data were contributed, the number of cases and person-years contributed by each registry, and the percentage of cases and person-years contributed by each registry to the total pool.

For the contributing registries that included a sufficient numbers of cases in the dataset, the data are presented in the dedicated full tables. For the registries with smaller datasets that included at least 150 cases in the age range 0-14 or at least 200 cases in the age range 0-19 years, reduced tables showing a smaller amount of detail are presented in the following pages. The reduced tables provide the following statistics for each age range, diagnostic group, and subgroup: number of cases, male-to-female ratio, and ASR.

Small registries contributing to a national pooled are listed in the table of constituent registries, but there is no separate table provided. Such registries do not have any + in their line in the table below.

Comparative tables

These tables show the incidence rates for a selected diagnostic category across the selected datasets, including those presented in the full registry-specific tables and the tables for the pooled datasets. The datasets of the two specialized paediatric registries are included only in the relevant diagnostic category.

The titles of these tables contain the name of the diagnostic category, which matches the ICCC-3 categories used in the registry-specific tables. Data tables are available for 42 diagnostic categories, including all neoplasms. The webpage has a separate selection panel for the main diagnostic groups and the diagnostic subgroups; however, the template of all the comparative tables is identical.

The populations compared in the tables are listed in alphabetical order by world region, country, state, region, and ethnic group. For a given country, the national datasets are listed first, followed by paediatric registries, where they existed, and then by the other regional registries in alphabetical order. The following abbreviations are used for the ethnic groups in these tables: API, Asian or Pacific Islander; NH White, Non-Hispanic White.

The column headings are defined in the same way as in the Full table for a single registry. Incidence rates based on fewer than 10 cases are given in italic. Numbers and rates for the age group 15-19 and the age range 0-19 are not provided for paediatric registries that collect data only for the age range 0-14 years, and this is indicated in these tables by a hyphen.
